Axiom Trade API and docs: what is actually available

Axiom does not offer a public API or API keys to retail traders. What it does offer is a set of built-in tools that cover most of what people want an API for. This page separates what exists from what is sold under the Axiom name.

Is there an Axiom Trade API?

Not a public one. Axiom runs its own execution and data infrastructure, and the terminal, mobile app and Chrome extension talk to it through private endpoints. Axiom has not published endpoint documentation, rate limits or an API key system for third parties, and its terms do not permit scraping or automating the interface. If that changes, it will be announced on Axiom's official channels, not through resellers.

Any listing offering an "Axiom Trade API key", "Axiom Pro API access" or a paid "Axiom bot with API" is unaffiliated with Axiom. Several are phishing operations that ask for your private key to "connect".

Axiom tools that replace an API for most traders

Want to automate	Built-in Axiom tool
Enter when a wallet buys	Copy trading rules with size, slippage and filters
Exit at a target or a stop	Server-side take-profit and stop-loss by price or market cap
Buy from a social post	Chrome extension buy buttons on X
Get notified on wallet activity	Tracker alerts via push and Telegram
Repeatable order settings	Presets for amount, slippage, priority fee and bribe
Screen tokens automatically	Pulse filters for liquidity, holders, dev history and socials

For most retail strategies this covers the ground. The guides for [copy trading](#), [wallet tracking](#) and the [sniper workflow](#) explain each.

Axiom Trade docs and official resources

- **Help centre and feature guides.** Published by Axiom and linked from the terminal's support menu.
- **X account and Discord.** Product updates, outage notices and support threads. See the [support page](#).
- **In-app tooltips.** Every setting in the terminal has a short explanation on hover.

If you really need programmatic access

Build against Solana directly. A paid RPC provider plus a DEX aggregator SDK gives you swaps, and public indexers give you wallet activity. You lose Axiom's private routing and interface, but you gain full control. Many traders run their own bot for execution and keep Axiom open for discovery and tracking. That is a legitimate setup; wiring a bot into Axiom's private endpoints is not.
